induced rat mammary tumour."; Biochem. J. 283:209-216(1992) -I- FUNCTION: TRYPTASE IS THE

leupeptin-sensitive serine endopeptidase "Separation, purification and N-terminal

sequence analysis of a novel present in chemically

-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-|-, Lys-|-,

FUNCTION: TRYPTASE IS THE MAJOR NEUTRAL CELLS, AND IS SECRETED UPON THE COUPLED RESPONSE OF THIS CELL TYPE.

ACTIVATION-DEGRANULATION PROTEASE PRESENT IN MAST

with more restricted specificity than trypsin.
SUBUNIT: HOMOTETRAMER.
SUBCELLULAR LOCATION: RELEASED FROM THE SECRETORY GRANULES

FAMILY S1; ALSO KNOWN AS

THE

MAST CELL ACTIVATION.

                                              The present sequence encodes protease T protein. The protein is useful for treating a condition mediated by protease T. It is useful for treating an imbalance of desquamation, by topical application of a pharmaceutical composition containing the protease. The composition is useful as a topical skin care composition. It is useful as a laundry detergent, shampoo, hard surface cleaning composition, and dish care cleaning composition. Protease T protein is useful for treating and preventing skin flaking. It is less immunogenic to sensitive individuals and it provides efficient proteolytic activity in a non-natural
                                                                                                                                                                                                                                              Claim 2; Fig 1; 83pp; English.

Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical

Claim 3; Fig 221; 813pp; English.

AAS21244-AAS21518 encode for novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bloactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cells sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.

ARE03871-AAE03896 represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing, and their genes are useful for preventing, are threating or ameliorating medical conditions, e.g., by protein or gene through Pathological conditions and be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the C23 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of C3 genes based on the tissues in which they are most highly expressed, CC and include developing products for the diagnosis or treatment of C4 proliferative disorders, cancer, tumours, foetal and developmental cannormalities, haematopoietic disorders, diseases of the immune system, CC AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, CC allergies, neurological disorders (e.g., Alzheimer's disease, CC C2 arthright still disorders, angiogenic disorders, kidney disorders, asthma, CC cardiovascular disorders, angiogenic disorders, kidney disorders, angiogenic disorders, kidney disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Quality: 1571.00

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound ealing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding cDNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   adenocarcinoma and leukaemia; immune disorders such as AIDS, Addison's disease, diabetes mellitus, rheumatoid arthritis, multiple sclerosis, systemic lupus erythematosus, and myasthemia gravis; infections and trauma. Antagonists of the HTRM polypeptides are useful for treating or preventing disorders associated with increased expression or activity of HTRMs. HTRM polypeptides, their immunogenic fragments or oligopeptides are useful for screening libraries of compounds in drug screening techniques. Polynucleotides encoding HTRM are useful for blocking the transcription of mRNA and regulating gene function by modulating the activity of HTRM. Vectors expressing HTRM or agonists can also be used to prevent or treat disorder associated with decreased HTRM expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibodies which specifically bind HTRN and polynucleotides encoding HTRN are useful for diagnosing disorders associated with the expression of HTRN, particularly in assays that detect the expression of HTRN. Nucleotide sequences encoding HTRN may be useful to generate hybridization probes useful in mapping the naturally occurring genomic sequence and to detect differences in gene sequences among normal, carrier and affected individuals. Using diagnostic assays, cancer can be detected prior to the appearance of clinical symptoms and thereby progression of cancer can be prevented by aggressive treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        useful for preventing or treating disorders associated with decreased expression or activity of HTRM which include cell proliferative disorders such as arteriosclerosis and cirrhosis; cancers including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ52410-Z52474 are human transcriptional regulator molecule (HTRM) nucleotide sequences.                                                                                                                                                                                                                                                                       nment_block:
                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human nucleic acids (AA157798-AA161369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinyinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-APR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAI57798-AAI61369) and CC the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful CC immunosuppressant and cytostatic activity. The polynucleotide or of the invention may be used to treat diseases of the peripheral nervous System, such as peripheral nervous injuries, peripheral neuropathy and CC localised neuropathies and central nervous system diseases, such as CC Alzheimer's, Parkinson's disease, Huntington's disease, such as CC Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic CC lateral sclerosis, and Shy-Drager Syndrome. Other uses include the CC utilisation of the activity such as: Immune system suppression, CC and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, CC assays for receptor activity, arthritis and inflammation, leukaemias and CC c.N.S disorders.

CC Note: The sequence data for this patent did not form part of the printed head of the control of the printed activity.
                                                                                                                                                                                                                 Align seg 1/1 to: AAI60330

The promoter from the HELA2 gene is useful for testis-specific expression of other genes, e.g. for gene therapy or modulation of fertility. Drugs that block activity of HELA2 should have antitumour activity to ther than in testis recombinant HELA2 should stop growth of tumours and normalise sperm development (eliminating the need for orchidectomy). Identification of mutant forms of HELA2 can be used to diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAV59134-36 represent HELA2 homologues. The genes are found in a cluster on chromosome 16p13.3. HELA2 was isolated from HeLa cells, and has homology to serine proteases. The crotetin is involved in or associated with regulation of cell activity and/or viability. Administration of recombinant HELA2 (also called testisin) is used to increase fertility. Downregulation of HELA2 reduces fertility. HELA2 is also a suppressor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         18-NOV-1997;

Protease T is useful for treating a condition mediated by protease T. It is useful for treating an imbalance of desquamation, by topical application of a pharmaceutical composition containing the protease. The composition is useful as a topical skin care composition. It is useful as a laundry detergent, shampoo, hard surface cleaning composition, and dish care cleaning composition. Protease T protein is useful for treating and preventing skin flaking. It is less immunogenic to sensitive individuals and it provides efficient proteolytic activity in a non-natural
                                                                                                                                                                                                                     410
                                                                                                                                                                                                                                                                                                                                                                 360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         310
